

5 SYSTEM AND METHOD FOR USING A PLURALITY OF PROCESSORS
 TO SUPPORT A MEDIA CONFERENCE

ABSTRACT OF THE DISCLOSURE

 A system for using a plurality of processors to support a media conference
includes a mixing processor and a first media transformation processor coupled to the
10 mixing processor. The mixing processor mixes input media information associated
with two or more first participants to generate output media information for
communication to a second participant. The first media transformation processor
receives the output media information from the mixing processor, encodes the output
media information to generate an output data stream, and communicates the output
15 data stream to the second participant's end-user device.
